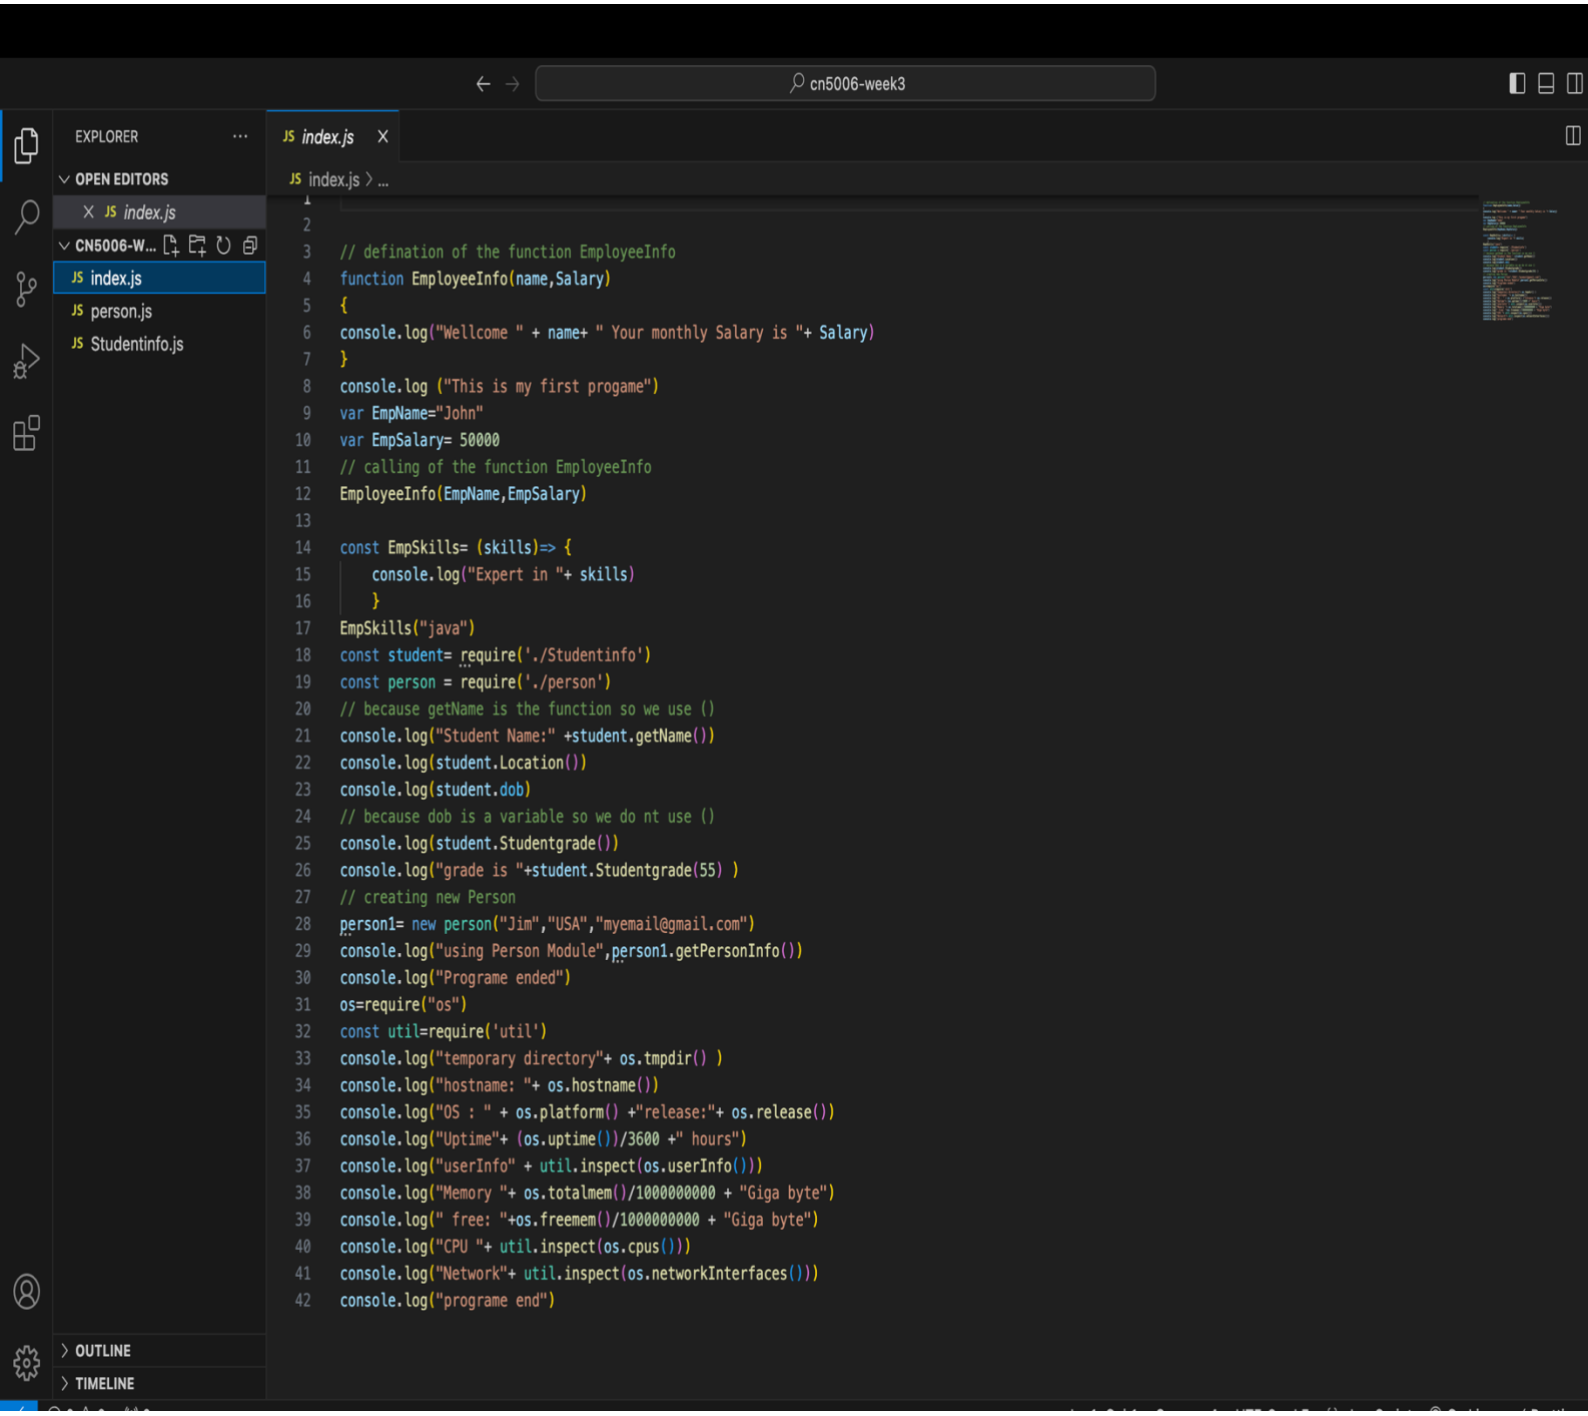
Week 3 lab

The index.js file is the main file from which the program is run in the terminal. It contains two modules which are local to the file. The StudentInfo.js module contains the information of the student (name, DOB, campus and grade) and the functions and variables stored inside them are exported to be accessed from the index.js file. The person.js module contains the class “student” from which objects are made. The module.exports line allows for the constructor class to be used in other files.



```javascript
// defination of the function EmployeeInfo
function EmployeeInfo(name,Salary)
{
console.log("Wellcome " + name+ " Your monthly Salary is "+ Salary)
}
console.log ("This is my first progame")
var EmpName="John"
var EmpSalary= 50000
// calling of the function EmployeeInfo
EmployeeInfo(EmpName,EmpSalary)

const EmpSkills= (skills)=> {
    console.log("Expert in "+ skills)
    }
EmpSkills("java")
const student= require('./Studentinfo')
const person = require('./person')
// because getName is the function so we use ()
console.log("Student Name:" +student.getName())
console.log(student.Location())
console.log(student.dob)
// because dob is a variable so we do nt use ()
console.log(student.Studentgrade())
console.log("grade is "+student.Studentgrade(55) )
// creating new Person
person1= new person("Jim","USA","myemail@gmail.com")
console.log("using Person Module",person1.getPersonInfo())
console.log("Programe ended")
os=require("os")
const util=require('util')
console.log("temporary directory"+ os.tmpdir() )
console.log("hostname: "+ os.hostname())
console.log("OS : " + os.platform() +"release:"+ os.release())
console.log("Uptime"+ (os.uptime())/3600 +" hours")
console.log("userInfo" + util.inspect(os.userInfo()))
console.log("Memory "+ os.totalmem()/1000000000 + "Giga byte")
console.log(" free: "+os.freemem()/1000000000 + "Giga byte")
console.log("CPU "+ util.inspect(os.cpus()))
console.log("Network"+ util.inspect(os.networkInterfaces()))
console.log("programe end")
```
