Week-8-Lab-Excercises

1.

The ".then" logic in this code ensures that the logic of the results is executed if the query is successfully finished. This in terms allows the results to only be displayed once the database query is completed.
The ".catch()" logic is executed only if any errors occur whilst running the database query.

```
var givenage = 15

person_doc.find({Gender:"Female" , age:{$gte:givenage}})

.sort({Salary:1})
.select('name Salary age')
.limit(10)
.exec()
.then(docs=>
    {console.log("Showing females with age greater than", givenage)
docs.forEach(function(Doc) {
    console.log(Doc.age,Doc.name);
})
})
.catch(err => {
    console.error(err)})
```

2.

```
.then((doc1) => {
console.log("New Article Has been Added Into Your DataBase.",doc1);
})
.catch((err) => {
console.error(err);
});

*/

manypersons=[{ name: 'Simon',age:42,Gender:"Male",Salary:3456 }
,{ name: 'Neesha',age:23,Gender:"Female",Salary:1000 }
,{ name: 'Mary',age:27,Gender:"Female",Salary:5402 },
{ name: 'Mike',age:40,Gender:"Male",Salary:4519 }
]

person_doc.insertMany(manypersons).then(function(){
   console.log("Data inserted") // Success
   }).catch(function(error){
   console.log(error) // Failure
   });

person_doc.find({})
```

The command insertMany() inserts multiple documents into the MongoDB collection. An array of documents (manypersons) is added to the person_doc collection. The operation is asynchronous, and .then() handles the success by logging "Data inserted," while .catch() handles any errors. This method is efficient for inserting multiple documents at once, reducing the number of database operations and ensuring better performance when handling bulk data.

3.

```
manypersons=[
{ name: 'Mary',age:27,Gender:"Female",Salary:5402 },
{  name: 'Jacky',age:32,Gender:"Male",Salary:3456 }
]

person_doc.insertMany(manypersons).then(function(){
   console.log("Data inserted") // Success
   }).catch(function(error){
   console.log(error) // Failure
   });

person_doc.find({})

.sort({Salary: 1})
.select('name Salary age')
.limit(20)
.exec()
.then(docs => {
   console.log('showing multiple documents')
   docs.forEach(function (Doc){
      console.log(Doc.age,Doc.name);
   })
})
.catch(err => {
   console.error(err)
```

I accidentally ran the manypersons command more than once therefore my documents were created to be even higher than what it was supposed to be.

5.

```
.exec()
.then(docs=>
    {console.log("Showing females with age greater than", givenage)
docs.forEach(function(Doc) {
